### Diagnosis

Bronchial Asthma - Acute exacerbation

### Clinical Summary

Known case of bronchial asthma for 6 years presented with increased work of breathing following viral upper respiratory tract infection. Responded well to ward nebulization protocol and oral methylprednisolone. Stable at discharge.

### Treatment Advised

Continue maintenance inhaler as advised previously by physician. Take oral antiallergic tablet at bedtime.

### Follow-up

Review in Chest OPD after 10 days for clinical reassessment.

### Warning Signs

Report to emergency if breathing difficulty worsens, persistent chest tightness occurs, or fever recurs.
